**AM3440-A**

**AM3440-B**

**AM3440-C**

## Description

The Loop-AM3440-A/B/C series are Access DCS-MUXs that combine various digital access interfaces into E1 or T1 lines for convenient transport and switching. The Loop-AM3440 Access DCS-MUX provides access for a variety of TDM, IP, and voice interfaces detailed on the next page. These interfaces are compatible with other Loop products. Using these products, a DTE interface can be extended over copper wire pairs or any E1/T1 transport facility. Each Quad E1/T1 plug-in card can have as many as DS0 124/96 time slots from G.SHDSL, RS232, X.21, V.35, V.36 and EIA530 / RS449 interfaces, which can be multiplexed to fill 4 E1/T1 lines. The AM3440 also supports fiber optical plug-in cards, which can be used to aggregate up to 4 E1 channels onto a single fiber optical interface to connect with other AM3440 devices or with the O9310-E1.

Each of the 3 models of AM3440-A, B, and C has a number of plug-in slots in single slot size and mini size. Card size to slot compatibility is detailed on the next page.

This unit is a full cross-connect and can act as a mini DACS: one or more of the WAN ports can be used as a Drop & Insert function with fractional E1/T1 lines, which can be muxed into a full E1/T1 line.

Redundancy is available in dual CPU controller and power supply options, making it an excellent fit for critical applications. The chassis does not need fan cooling, and thus does not have a fan, though an external fan tray is available.

The AM3440 supports local control and diagnostics by using a VT-100 terminal connected to the console port. There are LED indications for all plug-in cards. The AM3440 also supports Ethernet, Telnet, and SNMP, so that it can be controlled and diagnosed from remote locations. An in-band management channel with GUI is available.

The AM3440 consists of a rugged reinforced aluminum chassis, giving this equipment a durable structure and a long-lasting physical life.

<b>A</b>	A (exchange side) connects to B side. A side M lead to B side M lead, A side E lead to B side E lead.	

■ Where **n** is used to select QEM card signaling type (must select one):

<b>n =</b>	<b>Description</b>	<b>Note</b>
<b>O</b>	For voice transmission only.	Circuit Type doesn't matter.
<b>1</b>	Type I (Original) E&M Signaling Circuit	M lead provides discharge for the A side.
<b>2</b>	Type II Circuit. This design attempts to reduce ground noise by adding two leads: SB (Signal to Battery) and SG (Signal to Ground)	Reduced ground noise. Ground current is eliminated at the cost of two more wires per circuit.
<b>3</b>	Type III Circuit. The SG lead serves as a discharge for the M lead. Reduces delay caused by combination of (a) low current electronic detectors, and (b) long runs of the E and M leads.	Type III is rare because ground currents on the E return would cause noise
<b>4</b>	Type IV Circuit. Based on the Type 2 circuit. This E&M circuit provides symmetry.	

5	Type V Circuit. For applications where ground noise is not an issue. Based on the Type 2 circuit.
